Solid Waste Compost Tier I Permit # 3555066
Nov 11, 2023
Permit Modification - Tier II

Non Compostable Material

Type of waste streams to now be accepted: concentrated thc products, plastics, glass and food waste contaminated with medicinal properties (thc).

Volume: No greater than 600 lbs / month.

Protocol For Disposing Non Compostable Material

The non compostable material will be transported in air tight, water tight containers and stored inside a secure storage area before being processed in a contained vessel located on a concrete slab inside our permit area.

This material will be removed from the original containers and placed directly into a commercial shredder that will reduce the volume while mulching and mixing with inadvertent material (bokashi - fermented feedstock to further break down contaminants).

After shredding, the material will be conveyed by an auger into its final storage area - a 26' container. The container is equipped with air vents to prevent heat or pressure build up. The lower walls and floor are water tight, containing all liquids that may be created during the mixing and mulching process.

Monitoring

A visual inspection will be done through double swinging doors in the rear part of the container several times throughout the process to ensure all contaminants are rendered non usable and non recognizable while also confirming no excessive heat / moisture build up.

Daily inspections after use are executed around the air tight, water tight floor of the holding container. If a non foreseeable leak has caused liquid to spill out from the holding area, we have a transfer pump is on location that can suck liquid from the ground and place it in a 250 gallon holding tank.
